Verification Guide: Optically Variable Devices (OVD) and Holographic Overlays

Type: technical_guide | **Date:** 2022-09-05

1. DOVID and Kinegram Classifications

Diffractive Optically Variable Image Devices (DOVIDs), including Kinegrams and holographic patches, display dynamic kinematic effects, color reversals, and 3D visual depths under varying angles of incident light. In automated KYC video capture, dynamic liveness checks track the angular movement of high-intensity specular reflection.

2. Optically Variable Ink (OVI) Characteristics

True OVI pigments contain microscopic multi-layer interference flakes that shift color depending on viewing angle (typically magenta to green, or gold to blue). Scanning or color photocopying produces only a single static flat tone without spectral phase shift.
